

## Cisco Power Calculator -Power Results

*Disclaimer: The Cisco Power Calculator is intended to be an educational resource and a starting point in planning your power requirement; it is not a final recommendation from Cisco. This tool does not check for software compatibility. To determine the power requirements and software most appropriate for your company we suggest you work with a Cisco representative, Cisco channel partner or a solutions provider.*

### Product Family:Catalyst 6500

13	WS-X6608-E1	--	--

Minimum Power Supply		Percentage Of Power Used	
Single/Redundant PWR-4000-DC 3 inputs		90.16 % 	
First Alternative Power Supply		Percentage of Power used	
Combined WS-CDC-2500W		88.34 % 	
Total Output Current(@42V)	Total Output Power	Total Typical Output Power	Total Heat Dissipation
81.71 Amps	3431.90 Watts	2745.52 Watts	15204.98 BTU/Hr

## Quick Facts

Selected Chassis	WS-C6513-E
Selected Supervisor Engine	WS-SUP720-3BXL
Selected Voltage	-60 Volts DC
Selected FanTray	WS-C6513-E-FAN
Chassis Slots	13
Power Supply Options	Single/Redundant PWR-4000-DC 3 inputs
	Combined WS-CDC-2500W
	Combined PWR-4000-DC 2 inputs
	Single/Redundant PWR-6000-DC with a Triple -60V input
	Combined PWR-6000-DC with a Dual -60V input
	Single/Redundant PWR-6000-DC with a Quadruple -60V input
	Combined PWR-4000-DC 3 inputs
	Combined PWR-6000-DC with a Triple -60V input
	Combined PWR-6000-DC with a Quadruple -60V input
Line Card Slots	12
Rack Units	19

**PLEASE REFER TO THE NOTES PAGE FOR IMPORTANT INFORMATION :**

NOTE :

- The Catalyst 6500 backplane power connectors for the linecards, fan trays and Supervisors operate at 42V. The power supplies take the power from the source and convert it into a 42V feed for these power connectors.
- Output Power is the amount of power delivered from the Power Supply to the Catalyst 6500. To figure Input Power, divide output power by .85 (typical efficiency of the power supplies).
- Output Power and Heat Dissipation numbers computed by the Cisco Power Calculator are maximum values and can be used for facility power and cooling capacity planning. These figure are not indicative of the actual power draw or heat dissipation. Typical power draw is about 20% lower than the maximum value shown. Also note that most of power allocated for PoE devices is dissipated at the end points.
- Output from the Cisco Power Calculator may not match the output from "show power" or certain "show energywise" commands due to the way the system dynamically allocates power for PoE device bootup. This dynamically allocated power will not affect the overall selection of the proper power supply by the Cisco Power Calculator.
- The Power Calculator attempts to provide the power budget rules employed in the latest software releases. It does not account for changes in the power management software made in previous versions. Please consult the power management section of the Release Notes for a history of changes to the software power management operation.
